Precision right down to the tiniest drop.

Giving a hand to oral health.

KULZER
MITSUI CHEMICALS GROUP

iBOND® Adhesives and GLUMA® Desensitizer

More precise, more economical –
with drop control.

Have you and your assistant ever complained about that drop running
down the dropper, jamming the cap?

That becomes a thing of the past with our newly designed droppers for
bonding agents and desensitizers. The notched design not only prevents
drops from running down the bottle. It actually ensures a better cut of the drop.

The new drop control entails several other benefits:

- No jamming or soiling of the opening.
- A very precise output of bonding agent: Depending on the applied
pressure on the unique squeezable bottle, you can produce a smaller
or bigger drop – always with a clean cut.
- The amount of single drops goes up to 220 per bottle.
Roughly 30% more output than with the old dropper design.

Our quality seal: It cracks with the first opening

Every bottle of bonding agent and desensitizer now also comes with a quality seal that cracks when you first open it. This seal tells you that the bottle fulfills our quality standards and is untapped.

It is always our aim to make your daily business more convenient and efficient for you. You will quickly come to appreciate the precise drop control and the opening protection. Why not enjoy the comfort of quality material in well-thought-out packaging?
